[SUMMARY]

Design UI Radar/Spider Charts to easily display and compare data with multiple variables. Ideal for Role Playing Games or statistics applications.

[FEATURES]

- Multivariable: Display any amount of variables
- Multidata: Display multiple data on the same variables to easily compare
- Highly Customizable: Control the color and shape of just about anything in the graph
 - Horizontal Guide Lines
 - Vertical Guide Lines
 - Vertex Labels
 - Data Fill and Line
 - Horizontal Regions
 - Data Vertices

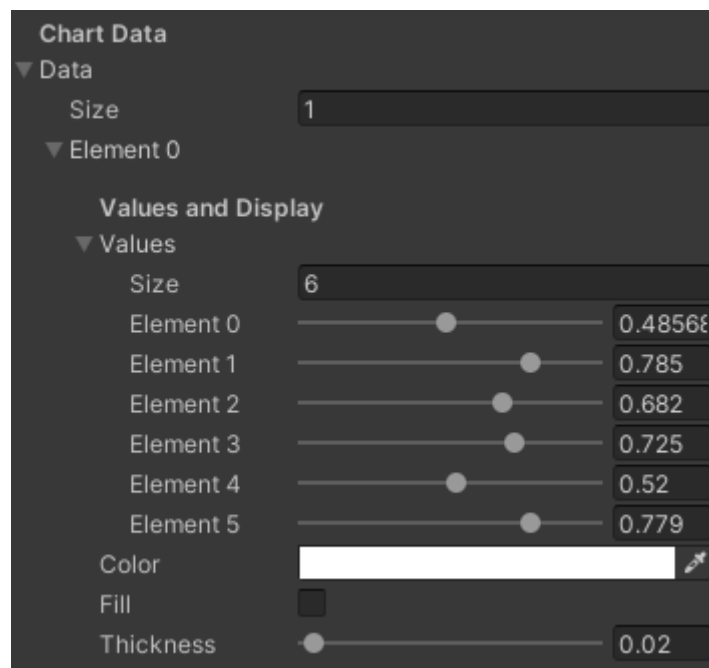

- Editor and Runtime: Easy to prepare in Editor and change at runtime

[USAGE]

Simply add the RadarChart component to a child of a Canvas gameobject from the Component menu or by attaching the RadarChart.cs script. Set the data values in the Data structure in Editor or at Runtime and configure the various display settings available

Sides - Number of sides of the radar graph
 Rotation - Offset rotation of the radar graph
 Background - Background color

Data - List of data entries
 Values - Values of the data in each axis from 0% to 100%
 Color - Color of the data line
 Fill - Display the data as a filled polygon instead of a line

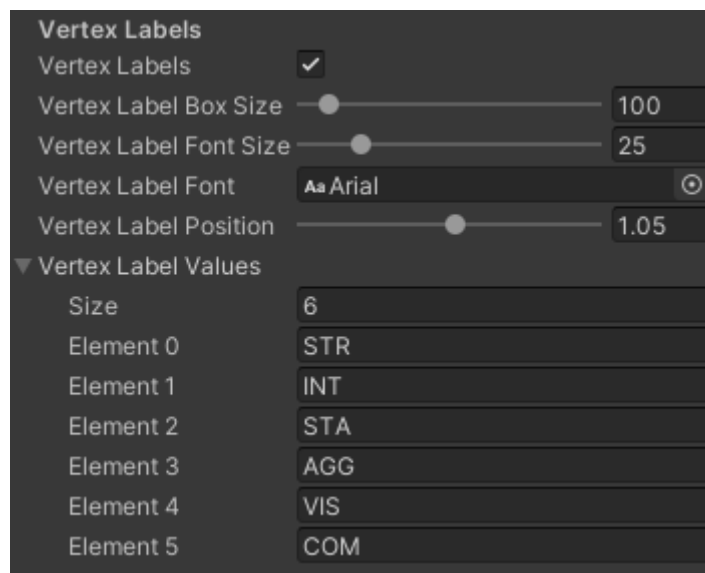

Data Points - Display a regular polygon at the tip of each data value

Data Points Diameter - Diameter of the data points 0% to 100% of total width of the graph

Data Points Sides - Number of sides of the polygon

Data Points Rotation - Offset rotation of the data points polygon

Data Points Color - Color of the data points polygon

Vertex Labels - Display labels on the vertices of the graph

Vertex Label Box Size - Size of the vertex label text box, should be enough to accommodate its font size

Vertex Label Font Size - Font Size of the vertex label

Vertex Label Font - Font used on the vertex labels

Vertex Label Position - Position of the vertex label in relation to the radius of the graph, between 0 and 2

Horizontal Lines - Display horizontal guide lines

Horizontal Divisions - Number of horizontal lines to display

Horizontal Line Thickness - Thickness of the horizontal lines 0% to 100% of total width of the graph

Horizontal Line Color - Color of the horizontal lines

Regions - Fill colored regions in the graph lerp'ing between the inner and outer colors

Regions Inner Color - Color of the most inner region

Regions Outer Color - Color of the outermost region

Vertical Lines - Display vertical guide lines

Vertical Line Thickness - Thickness of the vertical lines 0% to 100% of total width of the graph

Vertical Line Color - Color of the vertical lines

Border - Draw a border around the graph

Border Color - Color of the border

Border Thickness - Thickness of the border 0% to 100% of total width of the graph

[ANTI-ALIASING]

The radar charts are displayed entirely using UI meshes. Currently, Unity does not support dedicated AA for UI meshes (2019 LTS), to obtain this effect the Canvas Render Mode must be set to "Screen Space - Camera" and the Camera must have AA activated.

[CLOSING]

Thank you for purchasing this asset.

If you need any help, support or even have suggestions or requests feel free to contact me by email
